Overview

Together with a PC und commercial modems, the Micro-PLC SIMATIC S7-200 is ideally suited for configuring a telemonitoring system. In such a system, it is the task of the S7-200 to record limits and process data of a machine or or plant. If there is an error such as limit underrange or overrange, the S7-200 autonomously dials the phone number of the host computer via a modem. As soon as the connection to the host computer is established, the S7-200 will send a station identification, a fault identification and optionally current process values.
